

1. Create a class called parent which contains a parameterized constructor having two parameters. Create a class child which contains the constructor with three parameters where two parameters will be of type parent. Create a method show() in parent class which displays the value of these two parameters. Override the method show() in child class which will display three. The two variables present in parent class as well as parameters in child class.
2. Write a program to demonstrate the utility of static keyword in case of variable.
